# Master Mind XP

The old brain game "Master Mind" was originally a board game. It required two people to play. One person set the KEY colors and controlled the result pins as the other player deduced the KEY. The game is more fun (in my opinion) in computer form, as it now requires only one player.

Beneath the KEY cap are four randomly selected colors. The GOAL is to determine the colors and their respective positions within seven moves.

The four result squares will show you how many colors are correct and how many of those colors are in the correct location. A white square indicates a correct color. A cyan square indicates a correct color is in the correct location. *These are NOT in respect to the positions!!*

Play it a few times and you will quickly get the hang of it. It's a good brain exercise.

SETUP

This version requires that you create a folder on your C:\ drive, in the PROGRAM FILES folder called "MasterMind." Copy the included "SOUNDS" Folder into the MasterMind folder. Compile the MasterMind program and place it in the MasterMind Folder. Create a shortcut for MasterMind.exe and place it where ever you want (for example, the desktop).

If you don't want sounds, REM out all the sndPlaySound commands. You can also change the paths and put the sounds and executable wherever you want. The sounds are the ONLY thing that require a hard coded path.
